

Reconciliation & Controls Platform — Product Overview

A unified enterprise platform for automated financial reconciliation, across banking, card payments, vendors, and rewards ecosystems.

Product:

Auto Recon Tool

Team:

1 Designer | 1 PM | 1 Researcher

Role:

Senior UX Designer

Timeline:

12 Weeks

20 Screens, 3 Views and Auto Recon Process

Project Overview

A unified enterprise platform for automated financial reconciliation, exception management, and operational controls, designed to help organizations reconcile high-volume transactions across banking, card payments, vendors, and rewards ecosystems.

What the platform does

The Reconciliation & Controls Platform (RCP) centralizes reconciliation processes that are traditionally managed across multiple systems and spreadsheets. It automatically matches transactions from different data sources, highlights exceptions, provides workflow-based approvals, and delivers real-time operational insights.

Breaking Legacy Barriers

Business Vision: The Reconciliation & Controls Platform is an enterprise-grade reconciliation solution that automates transaction matching, It is particularly suited for banking, credit card, payment processing, vendor finance, and loyalty reward operations where accuracy, auditability, and operational efficiency are critical.

Expected Outcomes: The case study highlights, Introduce a priority-first dashboard with Critical Exceptions and Recent Runs at the top.

Make the left navigation collapsible with expandable sections.

I created a cleaner enterprise UX while preserving the existing functionality.

The Core Problems!!

Information overload: The landing page displays multiple KPIs, owner names, timestamps, and actions simultaneously, making it difficult to identify the most important item.

Overcrowded left navigation: Navigation becomes overwhelming, especially for first-time users.

Filter panel consumes workspace: The persistent filter panel occupies nearly one-third of the screen, reducing the space available for charts and analysis.

The Solutions

Information overload: I introduced a priority-first dashboard with Critical Exceptions and Recent Runs at the top. Used card sorting process.

Overcrowded left navigation: Made the left navigation collapsible with expandable sections.

Filter panel consumes workspace: Converted the filter panel into a slide-out drawer to maximize chart space.

The Impact

Faster monitoring (50 to 60 %): Users can identify reconciliation health and critical exceptions at a glance instead of scanning multiple cards.

Quicker navigation (Decreased the searching Time): Simplified layout and improved information grouping reduce the number of clicks needed to reach detailed reconciliation views.

Reduced cognitive load (More Focused on the KPIs): Clear visual hierarchy and prioritized KPIs make the interface easier to understand for operations teams.

Role: Ownership beyond Design

Data & analytics ownership

- A reconciliation product is data-heavy, so designers can influence how data is consumed.
- Decided which metrics deserve primary visibility
- Designed exception prioritization instead of showing all data equally
- Introduced progressive disclosure for detailed reports
- Impact: Users spend less time interpreting data.

Process improvement

Own the workflow, not only the interface.

- Conducted discussions with reconciliation analysts
- Mapped pain points across daily monitoring workflows
- Validated the redesign during UAT with business users

Challenges Faced

Owned the end-to-end redesign of the Recon Monitoring module, partnering with product managers, finance operations, and engineering to redefine KPI prioritization, streamline reconciliation workflows, standardize reusable components, and support implementation through developer handoff and UAT.

Stack holder Mapping Principles

For the Reconciliation & Controls Platform, the end users are the teams responsible for monitoring, investigating, and approving financial transactions.

Primary end users:

- Operations Analyst (Primary User)
- Maker / Reconciliation Executive
- Checker / Finance Manager
- Super Admin

Stakeholders (indirect users)

- Finance & Accounting teams
- Risk & Compliance teams
- Internal Audit
- Product & Operations leadership

Automate the reconciliation workload:

Ingest data from multiple sources, auto-match transactions, and reconcile at scale with minimal manual effort.

Save time, close faster:

Real-time reconciliation dashboards and automated exception routing help teams reduce cycle time and close books on time.

Use tools with ease:

Intuitive dashboards, smart filters, and guided workflows make reconciliation simple, consistent, and effective.

Drive accuracy and control:

Configurable rules, tolerances, and validations ensure high match accuracy and reduce reconciliation risk.

See what matters:

Real-time visibility into matches, exceptions, aging, and trends to take action with confidence.

Strengthen collaboration:

Role-based workflows, comments, and audit trails bring teams together to resolve exceptions and drive accountability.

Outcome: Accurate reconciliations, faster close, stronger controls, and complete visibility across banking, card payments, vendors, and rewards ecosystems.

Automate — Simplify — Control — Collaborate — Deliver Value

My Approach Towards the Solutions

Discovery Phase

Goal: Understand Users, Understand Business Goals, Empathy/Mind Map.

The Research Inquiry: 5 Key Areas

1. Workflow Mapping

Understood how finance and operations users complete reconciliation from data ingestion to exception closure before designing the UI.

2. Tool integration

Referring to connect the platform with the external systems that generate financial transaction data, so reconciliation happens automatically instead of through manual uploads.

3. Cognitive friction

Most of the users put mental effort to understand what they're seeing and decide what to do next.

"Where should I look first?"

4. Error & Risk Analysis

Conducted Error & Risk Analysis by identifying high-risk reconciliation failure points across data ingestion, transaction matching, and exception handling.

5. Pain Points, Goals & Behaviour

Conducted user-centered research to identify key pain points, define operational goals, and map user behavior across the reconciliation workflow.

Key Research Findings

Inquiry Focus		Key Research Finding & Metric	Resulting Pain Point
	Data Volume & Complexity	High-volume transactions across banks, cards, vendors & rewards 70–80% growth in reconciliation data YoY	Data Overload
	Matching & Reconciliation Challenges	50–70% of exceptions arise from mismatches, format issues & timing differences Low auto-match rate (40–60%)	Low Match Accuracy & High Exceptions
	Manual Effort & Repetitive Work	60–80% of analyst time spent on manual matching, validation & follow-ups Repetitive tasks cause delays and burnout	Manual Dependency & Slow Turnaround
	Exception Management & Risk	60%+ exceptions lack clear ownership or SLA tracking High risk of delayed resolution & compliance gaps	Exception Backlog & High Reconciliation Risk
	Lack of Visibility & Control	Limited real-time visibility into reconciliation status & aging Poor exception tracking & audit readiness	Lack of Visibility & Control
	Operational Impact	2–5 day delay in close due to reconciliation bottlenecks \$1M+ potential financial leakage annually	Delayed Close & Financial Leakage

End User Interview

User

Mr. Sankha B

Senior Business Analyst

Technical Level:

Checker / Finance Manager

About the Role:

Validates the Maker's changes, approves reconciliations, and ensures compliance before closure.

Configures reconciliation rules, manages users, schedules jobs, and monitors system integrations.

How He Works:

- Configures reconciliation rules, Validates the Maker's changes,
- Manages users, approves reconciliations,
- Ensures compliance before closure, Schedules jobs.
- Monitors system integrations.

“ As an end users I operates Analysts, Makers, and Checkers working in finance operations. They rely on the platform to monitor reconciliation status, resolve transaction exceptions, and approve financial records with accuracy and auditability.”

Core business Data into Design

Easy download report

Filter Parameter side by side

Dashboard Statement Summary

Categorically divided sub headers

Easy Data Recognized Charts and Graphs

Sub Header for Product Name Display

Pie Chart for Data recognition

What Matters the Most

Area	Benefit
Accuracy	Reduces manual reconciliation errors
Speed	Automates matching of thousands of transactions
Compliance	Complete audit trail and approval workflow
Visibility	Real-time reconciliation status and KPIs
Flexibility	Supports multiple reconciliation types and payment networks

In one sentence: The application's primary value is automating financial reconciliation while giving operations teams complete visibility, exception control, and audit-ready governance.

Key Learnings

5 Core Learning Areas

4-Way Matching

Bank • Memo • Posting • Reject

Maker → Checker

Approval & governance workflow

Exception Analysis

Identify mismatches instantly

Real-time Dashboard

KPIs, trends & reconciliation health

Maker

Creates & submits

Checker

Verifies & approves

Audit Log

Tracks every action

Master Management — Why it matters

All reconciliation behavior is driven by configurable master data rather than hard-coded logic.

Rule Master

Defines matching logic & confidence

User & Role Master

Controls access permissions

Channel Master

VISA, RuPay, UPI, NEFT & more

Tolerance Master

Allowed variance for matching

Final Takeaway

The application's biggest strength is transforming thousands of financial transactions into trusted, audit-ready records through automation, exception intelligence, and governed approvals.

This layout is suitable for a case study presentation, executive review, or UX portfolio.

Thank You!

**You have successfully
viewed everything.**

Thank you so much
for reading and exploring the
Reconciliation & Controls Platform
case study.

**Your time and attention
are truly appreciated!**
